Emory Healthcare (U.S.): Virtual Nursing Program

Atlanta, GA – Emory Healthcare has officially launched a cutting-edge virtual nursing program designed to enhance patient care by integrating AI-driven remote technology. This pioneering initiative allows nurses to remotely monitor, assess, and support patients in real-time, marking a significant step forward in the digital transformation of healthcare delivery.

The virtual nursing model leverages advanced artificial intelligence tools and secure video conferencing systems to enable licensed nurses to perform key functions—such as patient education, discharge planning, and vital signs monitoring—from centralized hubs. This not only reduces the burden on bedside staff

but also ensures that patients receive timely and continuous care.

"By embracing virtual nursing and AI capabilities, we're not only increasing operational efficiency but also providing a more personalized and proactive approach to patient care," said Dr. Dane Peterson, President and COO of Emory Healthcare. "Our goal is to create a seamless care experience that combines the best of human expertise and technological innovation."

The program is part of Emory's broader digital health strategy, which focuses on improving patient outcomes, optimizing workflows, and addressing workforce challenges such as staffing shortages. Early pilot results have shown promising outcomes in patient satisfaction and clinical efficiency.

As Emory Healthcare continues to evolve its virtual care offerings, the virtual nursing program serves as a model for how health systems can harness AI to reshape the future of healthcare—making it more accessible, responsive, and resilient.
